

Feature lifting: preserve behavior across a new package boundary

The source is implementation evidence; the new package is the evaluation target.

PACKAGE
BOUNDARY

1 Complete source

Pinned Blinker repository
Code, tests, docs, resources

Public output contract
Agent locates supporting code

2 New package

Agent extracts, adapts,
or reimplements the capability

featurelifted API
Own runtime dependencies

3 Source-free evaluator

Only the submission enters
Source repository unavailable

Build + Basic + Extended
+ Isolation

Preserved obligations: dispatch • weak-receiver lifetime • namespace identity

Repository editing

Existing project → patch → evaluation in that project

Feature lifting

Source evidence → new package → source-free evaluation
